

BOSE 4401

BOSE CORPORATION · THE MOUNTAIN · FRAMINGHAM, MASS. 01701

SOLID STATE FOUR CHANNEL PREAMPLIFIER

SPECIFICATIONS

The 4401 preamplifier offers four independent channels from input to output with a capability of matrix decoding, discrete four-channel, or stereo operation. Signals from all current program sources, both stereo and quadraphonic, can be processed by the 4401.

The 4401 incorporates unique phono preamp circuitry, utilizing MET™ (Minimum Effective Temperature) circuitry accounting for the ultra-quiet operation of the phono preamp.

Optional circuitry for the SQ decoder and the CD-4 demodulator is contained on easily-installed, plug-in modules.*

Internal provisions for an additional four-channel module are provided for yet-to-be-developed four-channel systems.

The tone control circuits, as well as the high and low filters, can be used to process a signal prior to recording. Recordings can be made on two tape recorders simultaneously, and tapes can be copied from either tape recorder.

The 4401 provides separate jacks for the connection of external equalizers. A rear channel equalizer by-pass switch allows equalization of only the front channels without the use of jumper cables for the rear channels.

GENERAL

Separate left/right balance controls for both front and rear channels.

Independent front and rear channel tone controls.

Baxendall tone control circuits for optimum frequency contour control.

Output amplifiers capable of driving both low and high impedance headphones.

Time delay circuitry eliminating turn-on transients.

Two-position phono capacitance switch for optimum matching of conventional or CD-4 phono cartridges.

Optional SQ decoder and CD-4 demodulator plug-in modules.*

Optional remote balance/volume control.

ELECTRONIC

Input Sensitivity:

Phono 1	2mv@1kHz
Phono 2	2mv@1kHz
Tuner	200mv
Aux.	200mv
Tape 1	200mv
Tape 2	200mv

Rated Output:

2v RMS. Minimum 7v RMS before overload.

Output Impedance:

600 ohms.

Input Impedance:

High Level	100k ohms
Phono (except	
CD-4 mode)	47k ohms

Frequency Response:

High Level-20-20,000Hz ±0.2db
RIAA Phono-Equalization ±1db

Distortion:

Harmonic Distortion \leq 0.2%, 20-20,000 Hz at rated output.
IM Distortion \leq 0.2% at rated output.

Hum and Noise:

High Level . . . Minimum 80db below rated output. Noise typically 90db down.
Phono..... 500 μ V A weighted. (Unweighted, typically less than 1 mV.)

Low Filter:

-3db@70Hz, 6db per octave attenuation.

High Filter:

-3db@7kHz, 12db per octave attenuation.

Tone Control Range:

Bass ±15db@50Hz
Treble ±15db@20kHz
Volume Muting..... -20db

POWER REQUIREMENTS

Voltage..... 105-130 Vac or 210-260 Vac
Frequency 50-60 Hz (ac only)
Maximum power consumption.... 30 watts

MECHANICAL

Dimensions:

6" high x 18" wide x 13 1/8" deep.

Weight:

12 pounds.

SERVICE MANUAL

Section 1

DISASSEMBLY PROCEDURE

I. Removing the Phono Board

- A. Remove the four screws holding the top cover in place.
- B. Locate the three interboard supports holding the phono board in place. Using needle-nose pliers, squeeze the locking pin of the interboard support and gently slide the board over the top of each support. It is suggested that the board be lifted to the point of just keeping the support from locking again. Do not attempt to remove the board until all three pins have been unlocked.
- C. Gently slide the phono preamp board up and off the interconnect points of J12 and J1 after releasing all three pins.

Special Note: When reassembling the phono preamp circuit to the upper board, be certain to align the pins of J1 first. Then, by rotating the preamp board sideways, easy alignment of the J12 pins can be accomplished, using the three interboard supports as guides for the reconnection of the printed circuit board.

II. CD-4 Four-Channel Decoding Board

After removing the top cover, locate the three interboard supports. Using needle-nose pliers, gently squeeze the locking pin of the interboard supports (as described in section I B) and slide the board up over the locking pins. (Do not attempt to remove the board until all three locking pins have been released.) Then gently pull the board towards the volume control side of the preamp, sliding the board away from the J201 connection pins.

III. Servicing the Top Board

- A. After removing the four screws holding the top cover in place, remove the top cover.
- B. If service of the section of the top board located under the phono preamp is required, see Section I above.
- C. If service of the other components of the top board is required, locate the section of the circuit by using the appropriate diagram.

IV. Access to the Lower Printed Circuit Board [Exposed Foil Section]

- A. Remove the seven screws holding the bottom cover in place.
- B. If service to the power transformer or ac switched and unswitched outlets is required, voltage conversion, or other similar service, remove the power supply shield by unscrewing the rear chassis screw holding the shield in place. (This is necessary for voltage conversion changes as well.)
- C. Access to all exposed components located on the lower board is now possible.

V. Access to Decoder Module

- A. Access to the bottom board is obtained as indicated in Section IV. Repair of either module can be accomplished by simply removing the screws holding the module to the rear chassis bracket assembly and sliding the module off its respective pin assembly (J101 or J102).

VI. Service of Foil [Etch] of Upper or Lower Board

- A. Remove the seven screws holding the bottom cover in place.
- B. Remove the decoder module(s) plugged into the bottom board (at connection Points J101 or J102).
- C. Remove the top cover by removing the four screws holding it in place.
- D. Locate the stud coming from front panel (above the source push button) and remove the nut, lock-washer, and flat-washer.
- E. Remove the knobs (not the push buttons) from the front panel. Be certain, when removing the knobs, to maintain the order and location of these knobs as they have been matched to each control for proper appearance and operation. (If difficulty is experienced in removing the knob, try using either insulated wire or heavy twine wrapped around the knob.)
- F. Very carefully, remove the headphone locking nut found on the front panel. Extreme care should be taken to not scratch the front panel.
- G. Remove the four $\frac{1}{2}$ inch locking nuts holding the front panel in place.
- H. Remove the two screws holding the lower pc board bracket assembly to the side chassis. These two screws are located near the front of the chassis on either side of the preamplifier.
- I. On the upper board, locate the six interconnect pin assemblies, J2, 3, 5, 6, 7, 8. (do not remove J4.) Remove these six interconnect pin assemblies connecting the upper board to the lower board by gently pulling the pin assembly upward until they are disengaged from the lower board. (Needle-nose pliers may be used to lift the interconnect pin assemblies away from the connector on the upper pc board. Do not remove the pins from the upper board.)
- J. Unlock the four interboard supports found near the rear edge of the lower pc board using needle-nose pliers. Do not attempt to raise the board off the supports, but rotate the board toward the front of the unit, releasing Connector J4 and the four interboard supports.
- K. With the preamp laying on its top with the volume control nearest the bench, lift the lower pc board out of the chassis assembly and lay it to your left. This completes major disassembly for service to the foil side of both printed-circuit boards.

Special Note #1: Care should be taken when extending the power transformer and headphone cables so that no tension is placed on the cable assemblies. It is unnecessary to unplug the power transformer when servicing the unit.

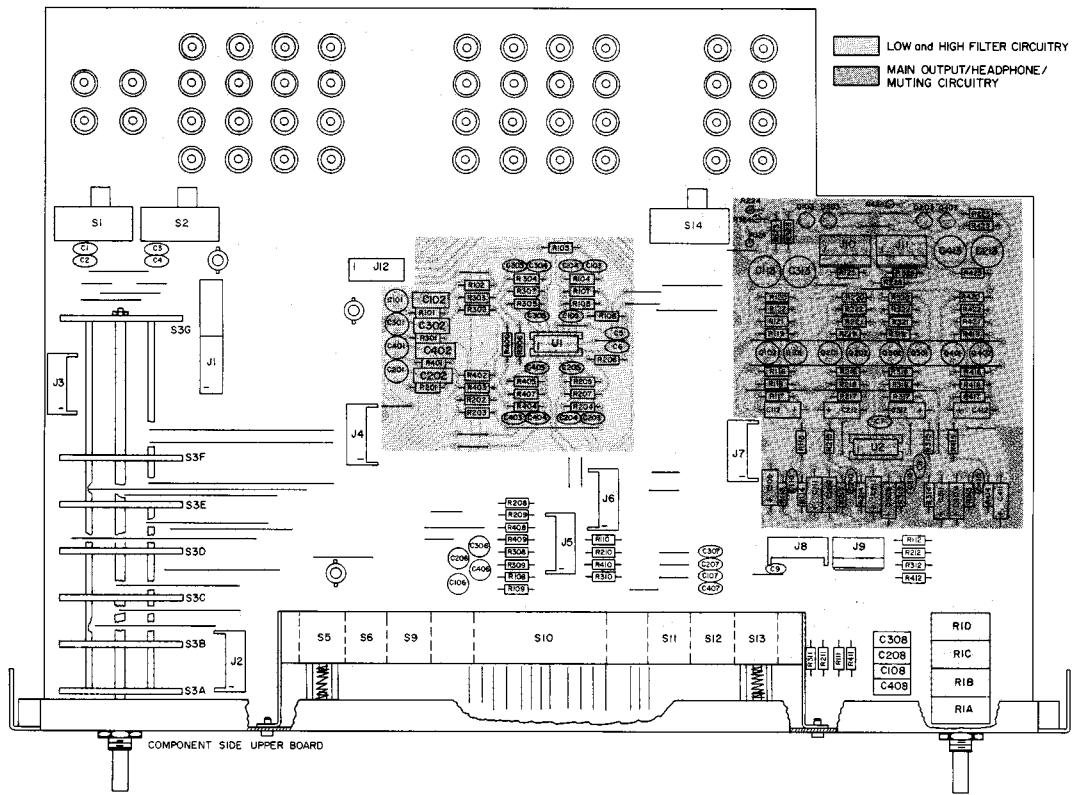

Special Note #2: When reassembling the preamp, make certain that interconnect board locking pins are secure when repositioning the board assemblies. Also, J4 interboard can be reinserted using a flat-blade screwdriver.

LOWER BOARD

PHONO BOARD

NOTES:

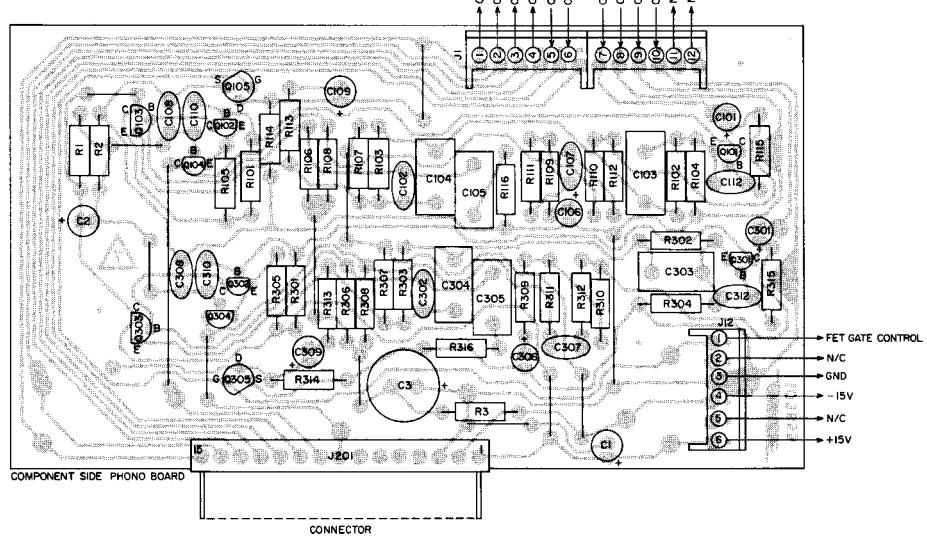

1. UNLESS OTHERWISE SPECIFIED:
ALL RESISTORS ARE 1/2 WATT, 10%
ALL CAPACITORS ARE IN MFD.
2. AC SIGNAL TRACING MEASUREMENTS OF THE PHONO
PREAMP BOARD ARE MADE WITH A SINE WAVE
AT 1kHz AND AT 1 MILLIVOLT INPUT.
3. TYPICAL DC VOLTAGES ARE SHOWN ON THE SCHEMATIC
AT SIGNIFICANT POINTS OF THE CIRCUIT.
10 PERCENT VARIANCE OF THESE VOLTAGES CAN
BE CONSIDERED NORMAL.
4. AC and DC VOLTAGES ARE BOTH SHOWN ON CHANNEL 1
ON THE PHONO PREAMP SCHEMATIC.

POWER SUPPLY

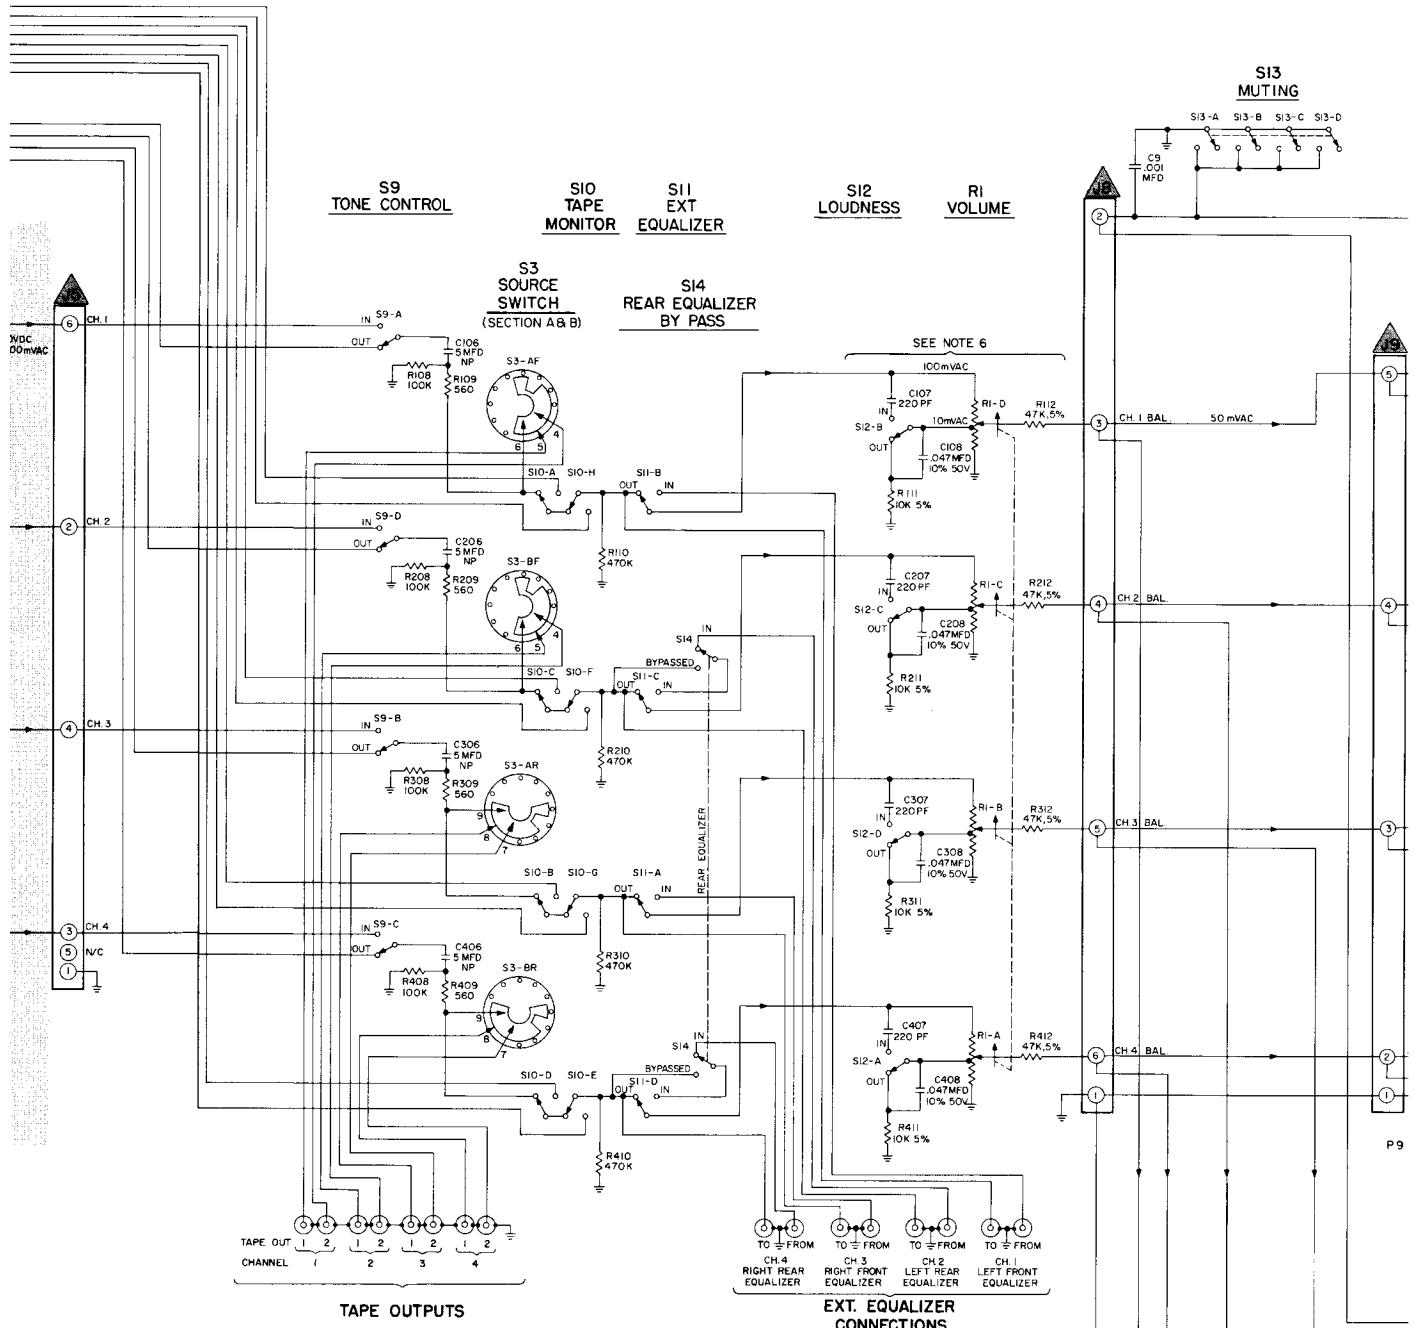

PHONO PREAMP
(SEE SCHEMATIC FOR FURTHER DETAILS)

CONSUMERS CONCERNED WITH HIGH ZERO VOLUME NOISE SHOULD FIRST BE REQUESTED TO ADJUST THEIR HIGH FIDELITY SYSTEM FOR OPTIMUM SYSTEM NOISE PERFORMANCE. START BY SETTING THE 4401 VOLUME CONTROL AT ZERO AND THE POWER AMP GAIN CONTROL AT FULL VOLUME. IF NOISE IS HEARD IN THE SPEAKERS, REDUCE THE POWER AMP GAIN CONTROL UNTIL THE NOISE JUST BECOMES INAUDIBLE. ALTERNATIVELY, UNITS CAN BE RETURNED TO BOSE FOR THE WARRANTY MODIFICATION, SHOWN ON THE ABOVE SCHEMATIC.
